

Cost Savings

The Kelly Tillage System is renowned for its very low cost of operation. Farmers can reap the benefits of our faster working speeds and wider machines, which achieve superior results with fewer passes. By using only a fraction of the fuel and manpower of other cultivation methods, the Kelly Tillage System helps to save money, fuel and time.

Herbicide resistance is proving to be an increasing problem for farmers, especially with chemical prices increasing. The Kelly Tillage System is a powerful tool for combating herbicide resistance by both controlling existing weeds and stimulating early germination of weed seeds in the field. By integrating Kelly tools into their weed control system, farmers can save money by reducing or completely cutting out herbicide use.

The Kelly Diamond Harrow frame is built from high strength steel and quality parts, and the unique Kelly Disc Chains are made from abrasion resistant metals. These tools are designed to last. Add to that the robust, simple design and fully sealed bearing units, and the result is a machine that performs for years with minimal maintenance.

The Kelly Tillage System has been designed to reduce costs in multiple areas, helping farmers to get a better seedbed for a better bottom line. Farmers are able to capitalise on the versatility of the Kelly Tillage System by using a single Kelly Diamond Harrow frame and a combination of discs to prep, mulch, incorporate, stimulate, propagate and manage throughout the year.
